Mississauga Halton Regional Hospice Palliative Care

Early Identification & Prognostic Indicator Guide

Guidance for clinicians to support earlier identification of patients nearing the end of life and who could benefit from a hospice palliative care approach

Why is it important to identify people nearing the end of life?

About 1% of the population dies each year. Although some deaths are unexpected, many more in fact can be predicted. This is inherently difficult, but if we were better able to predict people in the final year of life, whatever their diagnosis, there is good evidence that they are more likely to receive well-coordinated, high quality care.

This Early Identification and Prognostic Indicator Guide aims to help family physicians, specialist physicians and nurse practitioners in earlier identification of those patients nearing the end of life who could benefit from a hospice palliative care approach to care.

The tool has been adapted from the Gold Standards Framework (GSF) Prognostic Indicator Guidance tool developed by the GSF Centre in the UK. The UK has been using the tool along with a comprehensive education program to support GPs, care homes and general hospital staff in identifying patients and placing them on a register to help trigger specific support.

Varying Disease Trajectories

Three triggers that suggest that patients could benefit from a hospice palliative care approach

1. The Surprise Question: ‘Would you be surprised if the patient were to die in the next year?’

2. General indicators of decline: deterioration, advanced disease, decreased response to treatment, choice for no further disease modifying treatment.

3. Specific clinical indicators related to certain conditions.

Definition of Hospice Palliative Care

Hospice palliative care is a philosophy of care that aims to relieve suffering and improve the quality of living and dying. It strives to help individuals and families to:

- address physical, psychological, social, spiritual and practical issues, and their associated expectations, needs, hopes and fears;
- prepare for and manage self-determined life closure and the dying process;
- cope with loss and grief during the illness and bereavement;
- treat all active issues;
- prevent new issues from occurring;
- promote opportunities for meaningful and valuable experiences, personal and spiritual growth, and self-actualization.

---

**Ask the Surprise Question**

**Would you be surprised if the patient were to die in the next year?**

Refer to details below

- **NO**
- **NOT SURE**
- **YES**

---

**Do they have General Indicators of Decline?**

Refer to details below

- **YES**
- **NO**

---

**Do they have Specific Clinical Indicators?**

Refer to details below

- **YES**
- **NO**

---

**IDENTIFY**

Flag in patient’s medical record with identified palliative care needs

Refer to CCAC Palliative Care Program

**ASSESS**

Assess patient and family needs (i.e. disease management, physical, psychosocial, spiritual, functional status, goals of care)

Record goals of care/advance care planning discussions

**PLAN**

Participate as a member of the primary level palliative care team

If patient/family needs meet complexity criteria, discuss role of secondary level palliative care specialists, i.e. consultation, collaborative care/shared care, direct care

More details of indicators – the intuitive surprise question, general decline and specific clinical

### The Surprise Question

**For patients with progressive life-limiting illness – Would you be surprised if the patient were to die in the next year?**

The answer to this question should be an intuitive one, pulling together a range of clinical, co-morbidity, social and other factors that give a whole picture of deterioration. If you would not be surprised, then what measures might be taken to improve the patient’s quality of life now and in preparation for possible further decline?

### General Indicators of Decline

**Are there general indicators of decline and increasing needs?**

- Advancing disease – unstable, deteriorating complex symptom burden
- Decreasing response to treatments, decreasing reversibility
- Choice of no further disease modifying treatment
- General physical decline
- Declining functional performance status (e.g. Palliative Performance Scale (PPS) ≤60, reduced ambulation, increasing dependence in most activities of daily living)
- Co-morbidity is regarded as the biggest predictive indicator of mortality and morbidity
- Weight loss - >10% in past six months
- Repeated unplanned/crisis hospital admissions
- Sentinel event, e.g. serious fall, bereavement, retirement on medical grounds
- Serum albumin <25g/l

### Specific Clinical Indicators

Flexible criteria with some overlaps, especially with those with frailty or other co-morbidities

**a. Cancer - rapid or predictable decline**

- Metastatic cancer
- More exact predictors for cancer patients are available e.g. PPS, ECOG, PPI, PaP
- The single most important predictive factor in cancer is performance status and functional ability - if patients are spending more than 50% of their time in bed/lying down, prognosis is estimated to be about 3 months or less

**b. Organ failure - erratic decline**

#### Lung Disease (COPD)

- Disease assessed to be very severe (e.g. FEV1 <30% predicted)^
- Recurrent hospital admissions (≥ 3 in last 12 months due to COPD)
- Fulfills long term oxygen therapy criteria
- MRC grade 4 to 5 – dyspnea after 100m on the level or confined to house
- Signs and symptoms of right heart failure
- More than 6 weeks of systemic steroids for COPD in preceding 6 months

#### Heart Disease (CHF)

- CHF NYHA Stage 3 or 4 - shortness of breath at rest on minimal exertion
- Repeated hospital admissions with heart failure symptoms
- Difficult physical or psychological symptoms despite optimal tolerated therapy

Early Identification & Prognostic Indicator Guide

Guidance for clinicians to support earlier identification of patients nearing the end of life and who could benefit from a hospice palliative care approach

c. Frailty/Dementia - gradual decline

**Frailty**
- Multiple co-morbidities with significant impairment in day to day living and:
  - Deteriorating functional performance status
  - Combination of at least three of the following symptoms: weakness, slow walking speed, significant weight loss, exhaustion, low physical activity, depression

**Dementia**
- Unable to walk without assistance and
- Urinary and fecal incontinence, and
- No consistently meaningful verbal communication and
- Unable to do self-care without assistance
- Reduced ability to perform activities of daily living
- Plus any of the following:
  - Weight loss, urinary tract infection, severe pressures sores (stage 3 or 4), recurrent fever, reduced oral intake, aspiration pneumonia

**Stroke**
- Persistent vegetative or minimal conscious state or dense paralysis
- Medical complications
- Lack of improvement within 3 months of onset
- Cognitive impairment / post-stroke dementia

Palliative Performance Scale (PPSv2)

The Victoria Hospice Palliative Performance Scale (PPS, version 2) is an 11-point scale designed to measure patients' performance status in 10% decrements from 100% (healthy) to 0% (death) based on five observable parameters: ambulation, ability to do activities, self-care, food/fluid intake, and consciousness level.

Instructions on how to use the PPSv2 can be found at:

Early Identification & Prognostic Indicator Guide

Guidance for clinicians to support earlier identification of patients nearing the end of life and who could benefit from a hospice palliative care approach

MRC Grade 4-5
Medical Research Council dyspnea scale for grading the degree of a patient's breathlessness:

1. Not troubled by breathlessness except on strenuous exercise
2. Short of breath when hurrying or walking up a slight hill
3. Walks slower than contemporaries on the level because of breathlessness, or has to stop for breath when walking at own pace
4. Stops for breath after about 100 m or after a few minutes on the level
5. Too breathless to leave the house, or breathless when dressing or undressing

CHF NYHA Stage 3 or 4
Congestive heart failure New York Heart Association Classification:

- Class 1 – No limitation in physical activity. Ordinary physical activity produces no symptoms.
- Class 2 – Slight limitation in physical activity. No symptoms at rest. Symptoms possible with ordinary physical activity.
- Class 3 – More severe limitations in physical activity. Usually comfortable at rest. Symptoms with unusual physical activity.
- Class 4 – Inability to carry on any physical activity without producing symptoms. Symptoms possible at rest

Chronic Kidney Disease Stage 4 or 5

<table>
<thead>
<tr>
<th>Stage</th>
<th>Description</th>
<th>Glomerular filtration rate, ml/min/1.73 m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Kidney damage with normal or increased glomerular filtration rate</td>
<td>≥ 90</td>
</tr>
<tr>
<td>2</td>
<td>Kidney damage with mild decreased glomerular filtration rate</td>
<td>60–89</td>
</tr>
<tr>
<td>3</td>
<td>Moderately decreased glomerular filtration rate</td>
<td>30–59</td>
</tr>
<tr>
<td>4</td>
<td>Severely decreased glomerular filtration rate</td>
<td>15–29</td>
</tr>
<tr>
<td>5</td>
<td>Kidney failure</td>
<td>&lt; 15 (or dialysis)</td>
</tr>
</tbody>
</table>

*Kidney damage or glomerular filtration rate less than 60 ml/min/1.73 m² for 3 or more months.
†Pathologic abnormalities or markers of damage, including persistent proteinuria, abnormalities in urine sediment (persistent presence of erythrocytes, erythrocyte casts, leukocytes or leukocyte casts) or abnormal results in imaging studies (evidence of scarring or small kidneys on ultrasound or bilateral cystic changes consistent with polycystic kidney disease).

Child-Pugh Class C: 10 to 15 points; one year survival 45%; two year survival 35%
